**Gait & Movement Laboratory Team**  
Instituto de Rehabilitación Infantil Teletón Chile

# THE EQUIPMENT

MANAGERIAL CONSIDERATIONS

-  6 Infrared cameras (100Hz)
-  1 Pocket EMG Unit (16 channels)
-  2 Force platforms
-  2 Video cameras
-  Analysis software (SmartAnalyzer, Miolab)

# THE USE

## MANAGERIAL CONSIDERATIONS

The aim use of our gait lab is for the objective evaluation of the different treatment options to improve the gait. Like surgery, Botox blocks, physical therapy approach.

**Functional improvement in productivity, because it optimizes the available resources**

1. Clinical Use
2. Investigation (TRAMA)
3. Academic use

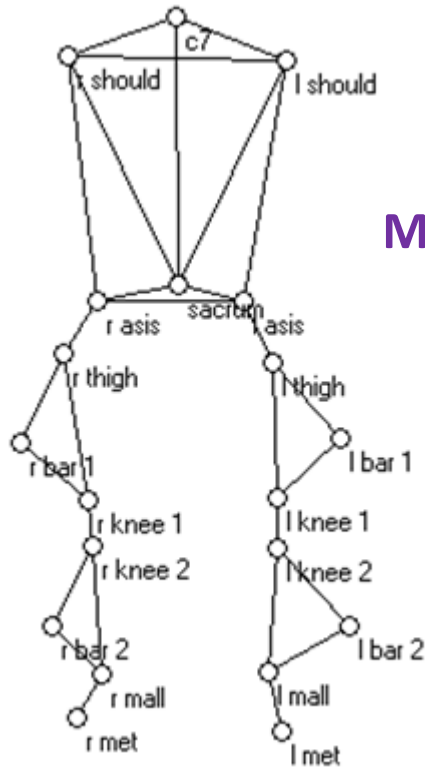

# THE PROTOCOLS

MANAGERIAL CONSIDERATIONS

Mainy (if not only) Davis Anatomical Protocol

**2010**  Upper extremities protocols  
 Postural studies

# THE PATIENTS

MANAGERIAL CONSIDERATIONS

The most frequent pathology is the Cerebral palsy followed by the Spina bifida and Neuromuscular diseases

# THE COSTS

MANAGERIAL CONSIDERATIONS

## INITIAN INVESTMENT

Equipment	USD 242.253
Room adecuation	USD 33.055

## UPDATES

Pocket EMG	USD 21.168
Software (SmartAnalyzer)	USD 19.057

## REMOTE SUPPORT

USD 35.393

## SUPPLIES (Monthly)

USD 550

# THE VALUES

MANAGERIAL CONSIDERATIONS

## FULL EXAM

(Gait Acquisition + physical examination: report and inform)

Internal Patient	USD	???
External patient	USD	277

**11 patients/week)**

**TOTAL: 2900** (2003-2009)

## THE PROBLEMS

### MANAGERIAL CONSIDERATIONS

-  Pocket-EMG interference (WiFi connection)
-  Little time to develop new applications
-  Hard disk failure (Patient data loss)
-  Data base difficult to manage
-  Incompatibility of some software

# INTRODUCTION

Myelomeningocelisis (**MMC**) it's a complex pathology, that involve many systems and it needs a comprehensive focus in rehabilitation.

# INTRODUCTION

The incidence of MMC in Chile has decreased since the introduction of folic acid in flour (Cortes et al.) And is now 1-2 x 1000 NB Live (\*).

But pathology remains **highly relevant** for the multisystem complications that produces and the high cost of their treatments

(\*) Referencia *Sociedad Chilena de Medicina Física y Rehabilitación*

# INTRODUCTION

Instituto de Rehabilitación Infantil Teletón Chile, annually serves **1300** children and young carriers of MMC, accounting for **6.8%** of the total patient population. *(Rotter et al, 2004).*

It is estimated the cost of rehabilitation care (medical checks, therapies, orthotics) in **USD 1293** *(Rotter et al)*

# INTRODUCCIÓN

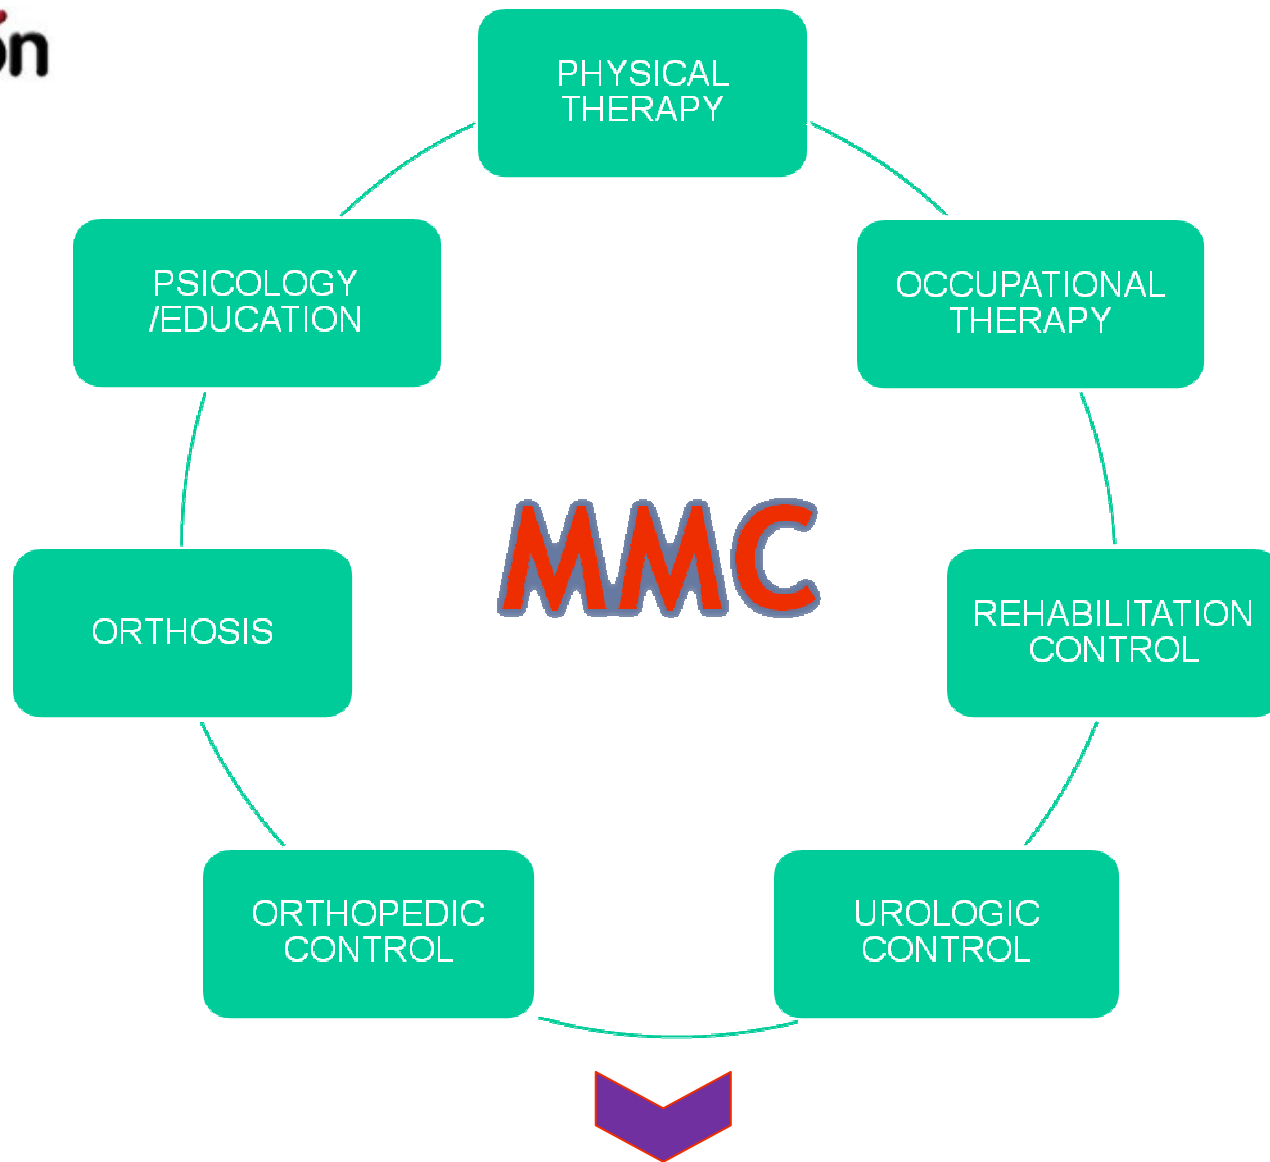

El Instituto de Rehabilitación infantil Teletón Chile, atiende anualmente a **1300** niños y jóvenes portadores de MMC, constituyendo el **6.8%** de la población total de pacientes (*Año 2004, Rotter et al*).

Se ha estimado el costo de las atenciones de rehabilitación (controles médicos, terapias, ortesis) en **USD 1293** (*Rotter et al*).

HIGHEST LEVELS OF INDEPENDENCE, AUTONOMY AND SOCIAL/  
FAMILIAR INTEGRATION

# RESEARCH PROBLEM

MMC IS A DISABLING DISEASE OF CHILDHOOD THAT PRESENTS A COMPLEXITY RELATED TO MOTOR FUNCTIONAL LEVEL CATEGORIZATION

CLÍNICAL CLASIFICACIONES HAVE TRIED TO DEFINE THE FUNCTIONAL MOTOR LEVEL AND ESTABLISH PROGNOSIS OF GAIT AND MUSCLE-SKELETAL COMPLICATIONS

CLINICAL ASSESSMENT CAN'T FULLY CHARACTERIZED THE MOTOR FUNCTIONLA LEVEL

***ASIMETRY / IRREGULARITY***

-  ANALYZE KINEMATICS CHARACTERISTICS OF A GROUP OF PATIENTS WITH MMC.
-  SET PARAMETERS TO QUANTIFY FUNCTIONAL MOTOR COMMITMENT
-  IMPLEMENT THESE PARAMETERS IN THE FUTURE TO ALLOW ASSESSMENT OF TREATMENT RESPONSE

# HYPÓTHESIS

 THERE ARE SIGNIFICANT DIFFERENCES IN THE BEHAVIOR OF KINEMATICS ACCORDING TO FUNCTIONAL COMMITMENT IN PATIENTS WITH MMC

 PARAMETERS OBTAINED FROM THE DATA KINEMATICS QUANTIFIES THE FUNCTIONAL COMMITMENT IN CHILDREN WITH FUNCTIONAL MMC

## CORRELATION FUNCTION

A method that can measure and quantify the similarity between two curves or graphical representations of functions.

Compare two sets of parameters quantitatively represented in curves of the same or different physical quantity .

The correlation functions expressed in a simple number, the percentage similarity between two curves or signals. Maximum value is 1 or 100%.

*DIRECT / INDIRECT CORRELATION*

# DEFINITIONS

## Z - SCORE

The Z Score (or absolute value of the normal distribution) is a function that measures the dispersion of each point of a curve of a patient in standard deviations (SD)

$$Z_{sc} = |x_i - X_i| / DS$$

# DEFINITIONS

## GAIT DEVIATION INDEX (GDI)

It's a new multivariate measure of overall gait pathology. The GDI uses kinematic data to derive a set of mutually independent joint patterns that efficiently describe gait. These patterns are called gait features. Linear combinations of the first 15 gait features produced a 98% faithful reconstruction of both the data from which they were derived.

The GDI and GGI are strongly correlated. The GDI offers an alternative to the GGI as a comprehensive quantitative gait pathology index for other pathologies different than cerebral palsy.

# GENERAL PURPOSE

DEVELOP A METHODOLOGY TO EVALUATE PATIENTS WITH MMC BASED ON SOME PARAMETERS CALCULATED FROM THE KINEMATIC BEHAVIOR AND ACCORDING TO MOTOR FUNCTIONAL LEVEL.

# SPECIFIC OBJECTIVES

 DESCRIBE KINEMATICS CHARACTERISTICS OF PATIENTS WITH MMC ACCORDING TO THEIR MOTOR FUNCTIONAL LEVEL

 CALCULATE CORRELATION COEFFICIENTS (CC) FOR EACH KINEMATICS CURVE

 COMPARE THE CORRELATION COEFFICIENT AND Z-SCORE WITH GDI

# MATERIALS AND METHOD

## CORRELATIONS FUNCTIONS

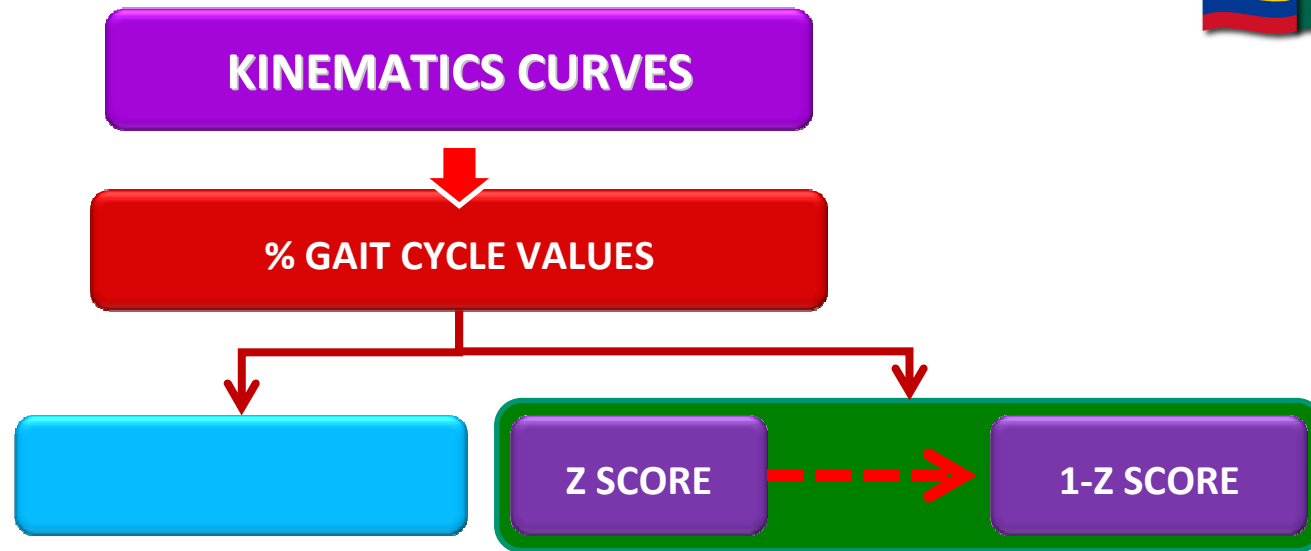

Permite medir y cuantificar el grado de similitud entre dos curvas o representaciones gráficas de funciones.

Compara cuantitativamente dos conjuntos de parámetros representados en curvas de igual o diferente magnitud física

Las funciones de correlación expresan en un simple número, **el % de semejanza** entre dos curvas o señales. Máximo valor que es **1 ó 100 %**.

**CORRELACION DIRECTA / INDIRECTA**

# MATERIALS AND METHOD

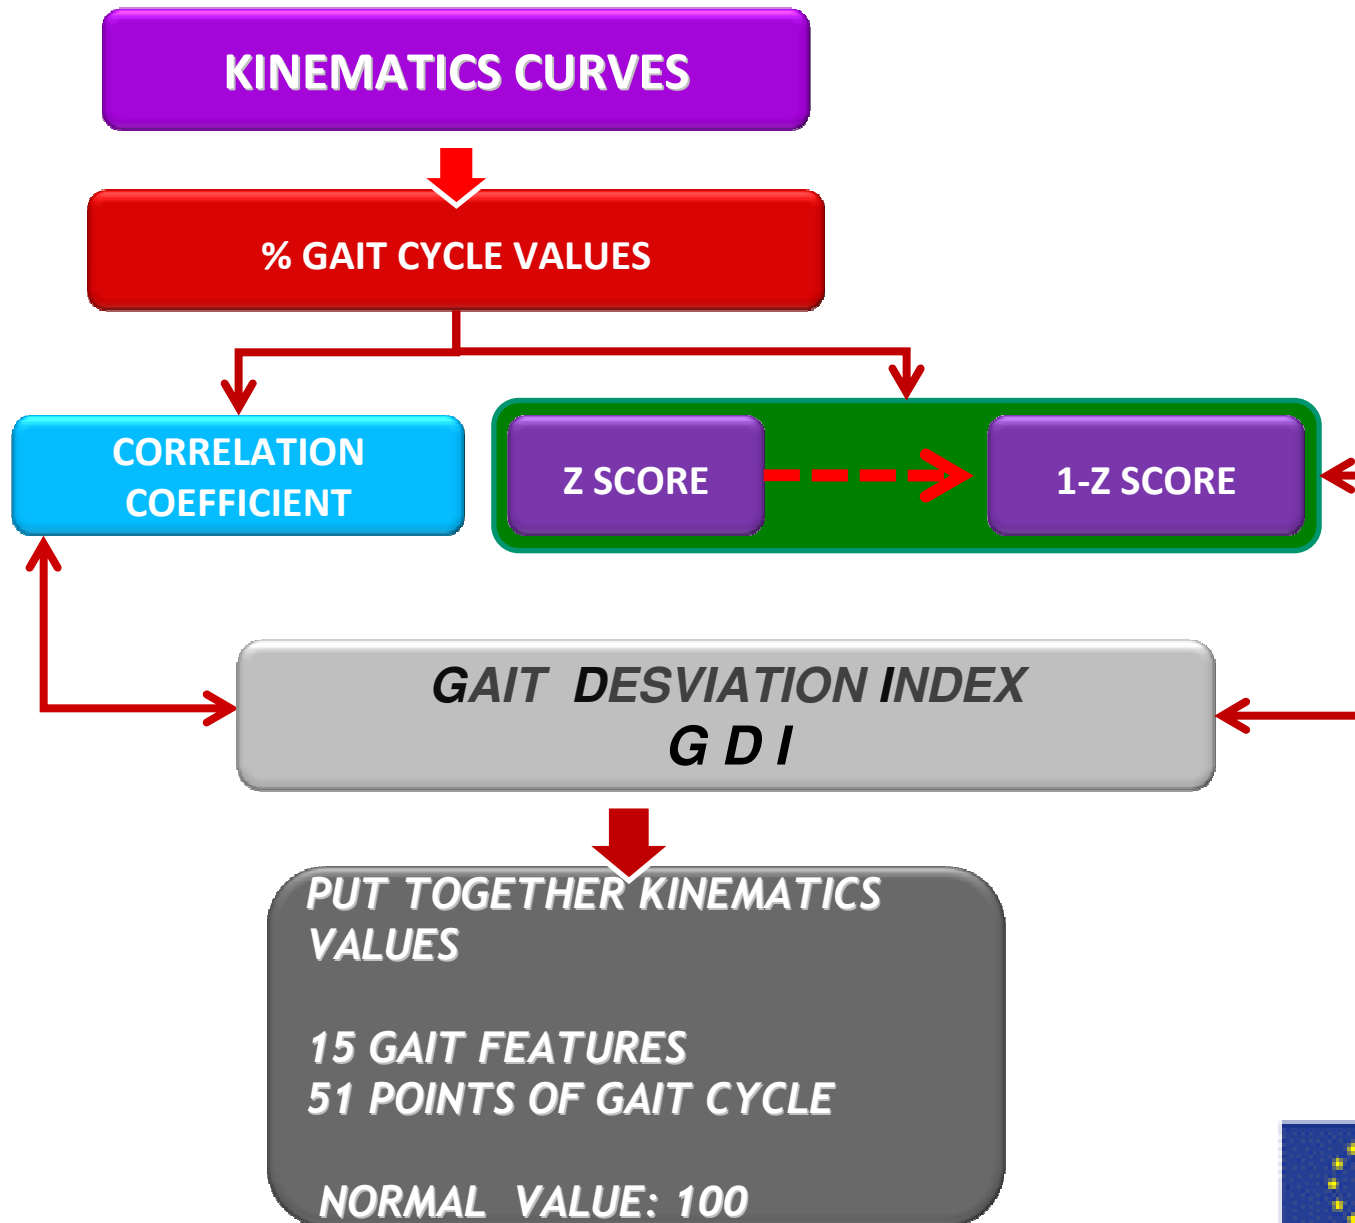

## Z SCORE

El Z Score (o valor absoluto de la distribución normal), es una función que mide la dispersión de cada punto de una curva de un paciente en Desviaciones Estándar (DS)

$$Z_{sc} = |x_i - \bar{x}| / DS$$

# MATERIALS AND METHOD

# SEÑALES BIOLÓGICAS

Los cambios fisiológicos de los seres vivos, ocurren en el tiempo, y el análisis de estas variaciones temporales en relación a la naturaleza y estructura, contribuyen al esclarecimiento de los procesos fisiológicos. Uno o mas parámetros que caracterizan a estos procesos y que varían en función del tiempo, se definen como “Señales Biológicas o Señales Biomédicas”.

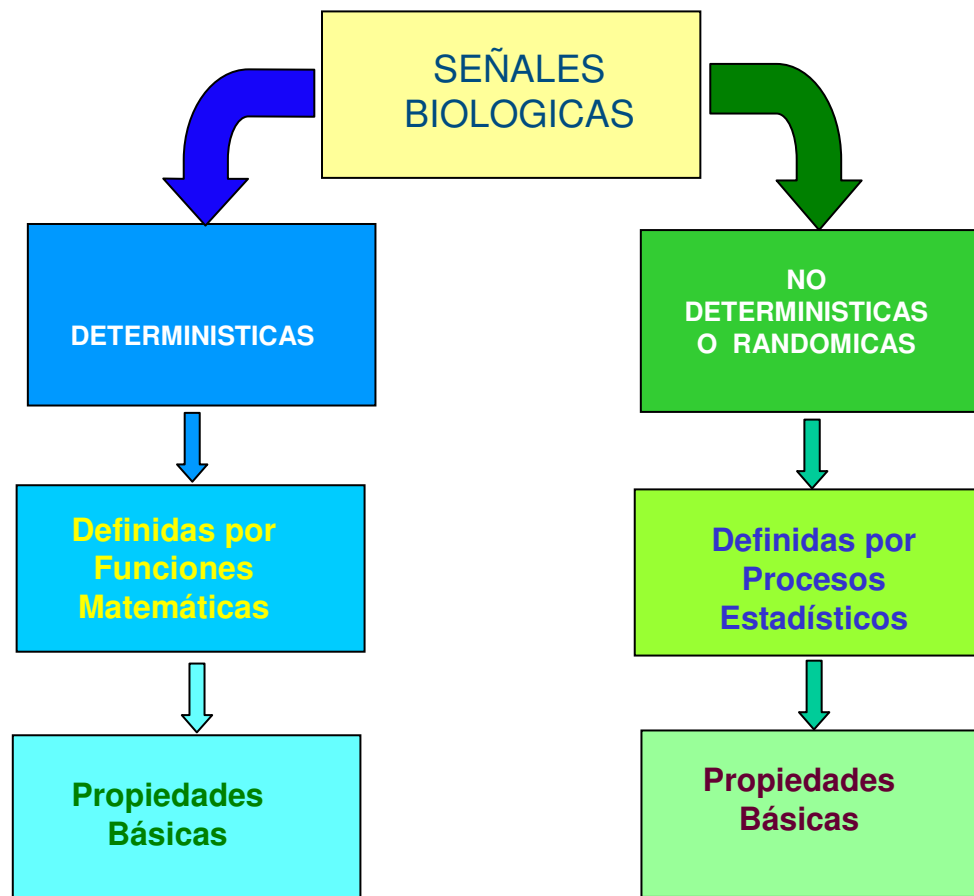

- **BIOLOGICAL SIGNALS**

The physiological changes of living organisms occur over time, and analysis of these temporal variations in relation to the nature and structure, contribute to the understanding of physiological processes.

- One or more parameters that characterize these processes, which vary with time, are defined as "biological signal or biomedical signal".

## RANDOM SIGNALS

### Some basic properties of Random Signals

curves

(Left and Right legs)

$k = 1, 2, \dots, O$  (O: N° of Subjects)  $O = 40$

## CORRELATION FUNCTIONS

One method that can measure and quantify the degree of similarity between two curves or graphs of functions is based on the application of correlation functions. [4], [5].

By definition: "A signal is the variation of a physical parameter with time or space" [4]; kinematics curves representing the angular variations of the lower extremity joints in terms of space or time, we can define as signals. Therefore, data obtained from the kinematic curves, can be subjected to all procedures and processes analysis in signal processing.

The correlation functions expressed in a single number the % of similarity between two curves or signals. The magnitudes of the correlations vary between "0 and 1" (direct correlation) or between "0 and -1" (in the case of inverse correlation) [6]. The correlation between a signal compared to itself gives the maximum value is "1" or 100%.

## Z SCORE FUNCTION

The Z Score (or absolute value of the normal distribution) is a function that quantifies the dispersion of each point on a curve and express this dispersion "std." [7].

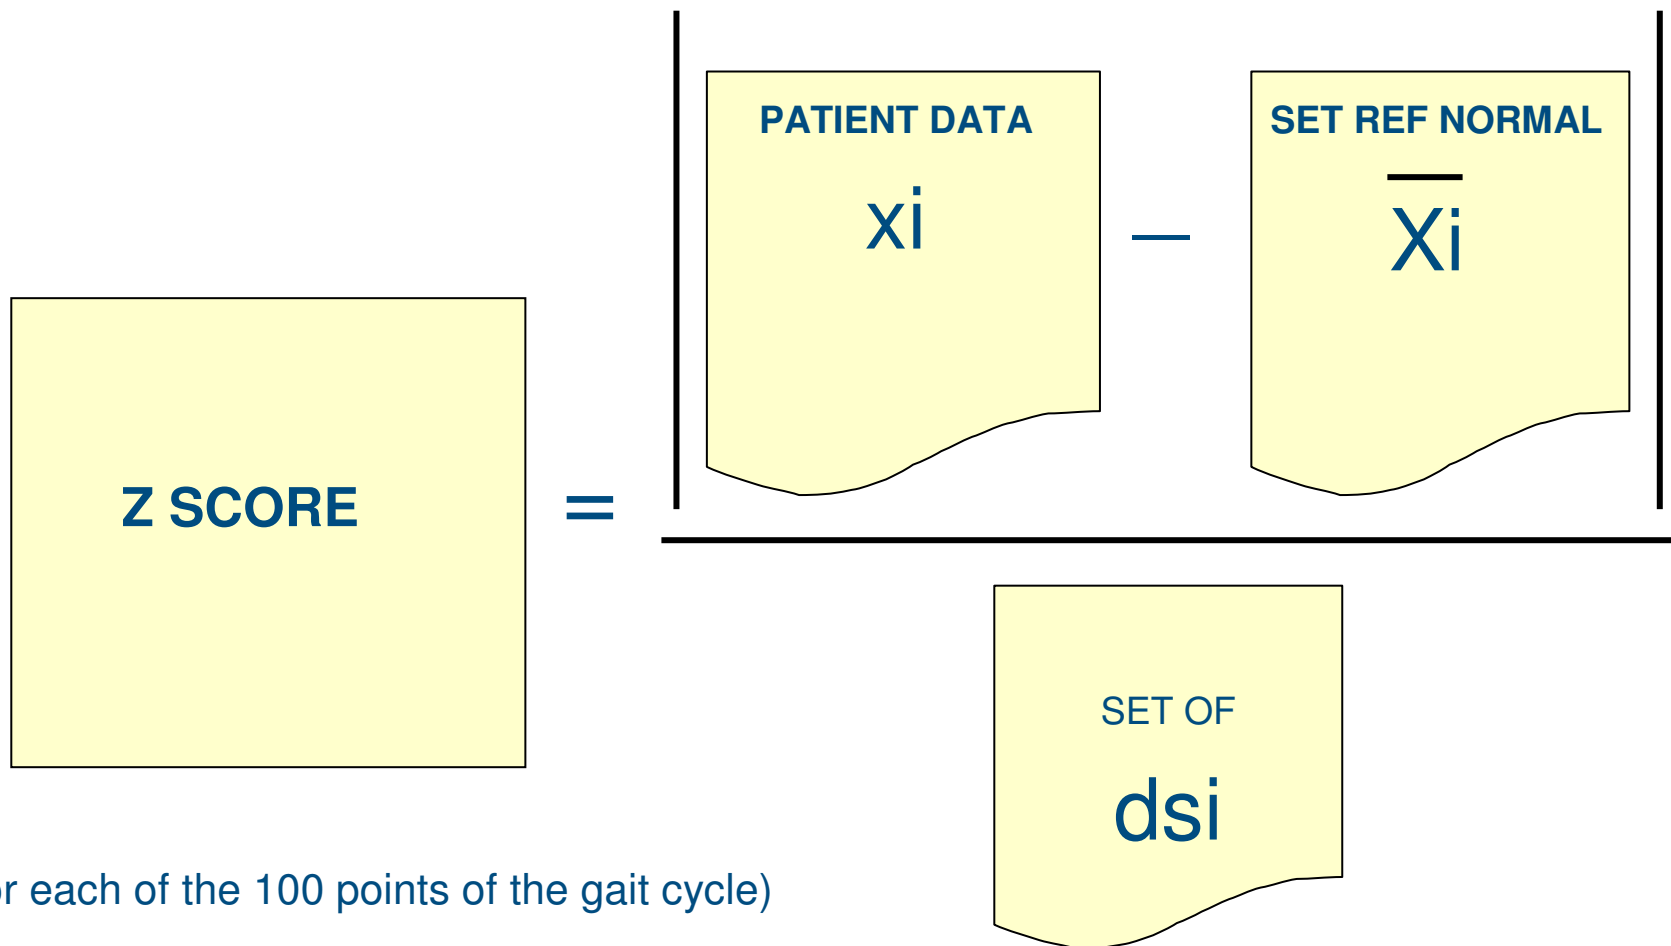

Mathematically, the Zsc is the absolute value of the difference between the values or data from the normal subject or patient, the less the normal mean value, divided by the corresponding standard deviation.

$$Z_{sc} = \frac{|x_i - \bar{X}_i|}{std_i}$$

$x_i$  (  $i = 1, 2, \dots, 100$ ): angular values of each of the 9 curves kinematic

$\bar{X}_i$  : Average value of normal angles of each point (Normal reference set)

std<sub>i</sub> : Standard deviation

(For each of the 100 points of the gait cycle)

## SUPPLEMENT Z SCORE

There is an inverse relationship between correlations and  $Z_{sc}$ ; If the correlation is maximum, 100%, means that there are scattered points of the signal under study, and therefore in  $Z_{sc}$  is zero.

However, If you want to establish a direct relationship between the correlations and  $Z_{sc}$  is desirable in connection with a function that has been defined as the  $Z_{sc}$  Supplement:

■

$$\mathbf{Supp\ } Z_{sc} = 1 - Z_{sc}$$

If  $Z_{sc}$  is greater than 1, then  $1-Z_{sc}$  is negative ( $Z_{sc} > 1 \Rightarrow 1-Z_{sc} < 0$ )

$$\mathbf{Supp\ } k\ Z_{sc} = 1 - (Z_{sc}/k)$$

for  $k = 1, 2, \dots, 10$

The constant  $k$  allows  $Supp\ Z_{sc}$  is always positive.

## GATE DESVIATION INDEX (GDI)

The GDI is a new multivariate measure of overall gait pathology. This index use kinematic data from a large number of walking strides to derive a set of mutually independent joint rotation patterns that efficiently describe gait[2],[3].

GDI  $\geq$ 100 indicates the absence of gait pathology.

Every 10 points that the GDI falls below 100 corresponds 1 ds.

## APPLICATIONS

Were considered in the study 19 patients with MMC. We proceeded to distribute them in 4 groups according to the level of motor commitment of both limbs, right and left:

Group	Levels	limbs
G1	L3	7
	L3+	2
G2	L4	13
	L4+	5
G3	L5	4
G4	S1	6
	S2+	1
	Total	38

**CC = 0,991**

**CC = 0,996**

## Mean values, (+/-) standard deviations of each function, applied to different motor levels of the study

## RESULTADOS PRELIMINARES

- Las Funciones de Correlación,  $1-(ZSc/k)$  y  $1-P(Z)$ , mantienen una misma tendencia al ser comparadas una a una con DGI.
- Al comparar entre sí los promedios totales de los resultados, relativos a cada una de las funciones además del promedio total del GDI, se obtiene que  $1-P(Z)$  vs  $1-(ZSc/k)$ , tienen la mayor correlación de 0,996, sin embargo, las relaciones cruzadas entre ellas, son superior a 0,95.
- La función que más discrimina entre el mayor y menor compromiso motor es  $1-ZSc$ , seguido de  $2*(1-P(Z))$ ,  $CCa$ ,  $GDI/100$  y finalmente los  $1-Zsc/k$ .

## FUTURE PROJECTIONS

### LISSAJOUS FIGURES APPLICATION

#### i) COMPARATIVE STUDY OF SIGNALS

Kinematics projects in the same reference planes  
(phase angle measurement)

#### ii) DISPLACEMENT OF SACRED STUDIES

Implemented in perpendicular planes

## LISSAJOUS FIGURES

A Lissajous figure is the trajectory of a moving point whose rectangular coordinates are simple harmonic motions.

The equation of simple harmonic motion can be expressed by:  $x(t) = A \sin(\omega t \pm \varphi)$

$t$  : time

$A$  : amplitude

$\omega$  : angular frequency or angular velocity

$\varphi$  : phase or lag.

## DELAY

# SINUSOIDAL FUNCTIONS

**Onda senoidal**

**Onda senoidal amortiguada**

Course "Motion A

- Clinical cases presentation - TRAMA Project – January 14 – 17<sup>th</sup> 2008

) ?”

## ANGLE MEASUREMENT OR CALCULATION OF DELAY

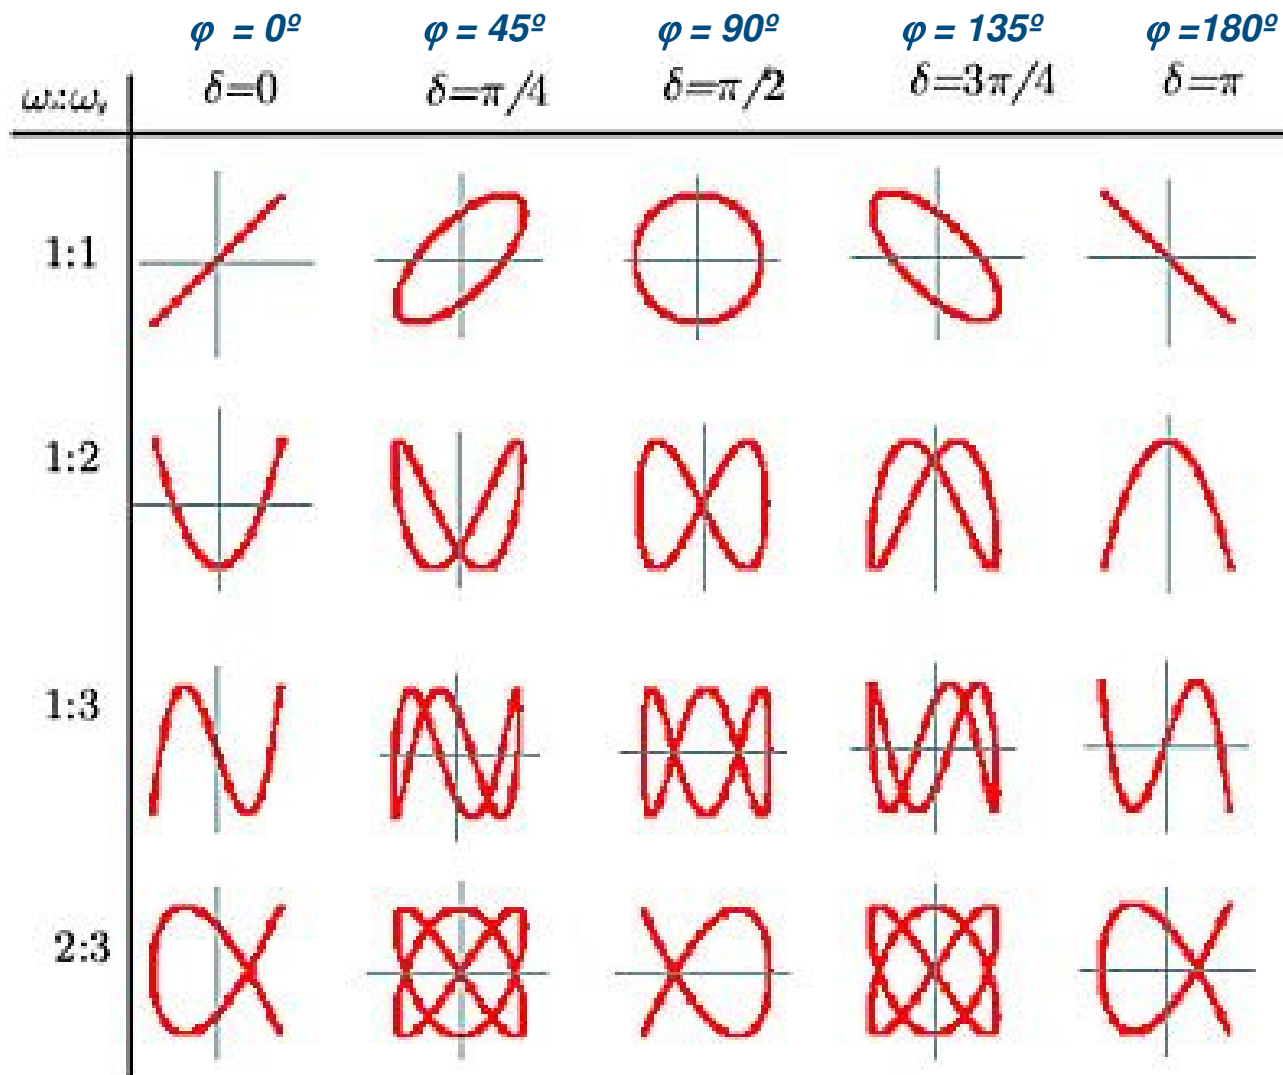

$$X = A \operatorname{sen}(\omega t) \quad y \quad Y = B \operatorname{sen}(\omega t \pm \varphi)$$

The phase of the Lissajous figure is calculated through the equation:

$$\mathbf{A/B = \operatorname{sen} \varphi \quad \Rightarrow \quad \varphi = \operatorname{arc} \operatorname{sen} (A/B)}$$

## RELATIONSHIP BETWEEN SIGNALS OF DIFFERENT FREQUENCIES

### ROT PELV

CC = 0,99

$$\varphi = 6^\circ$$

### ROT PELV

$$\varphi = \text{arc sen} (A/B)$$

$$\varphi = \text{arc sen} (1/10) = 6^\circ$$

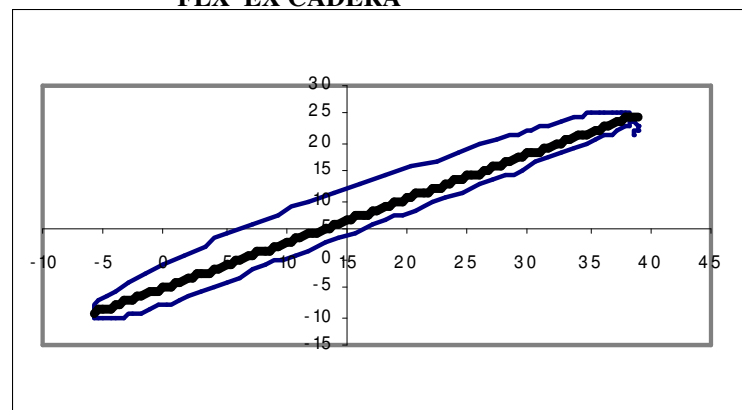

### FLX EX CADERA

CC = 0,97

$$\varphi = 10^\circ$$

### FLX EX CADERA

$$\varphi = \text{arc sen} (6/35) = 10^\circ$$

## DISCUSSION

Increasing the number of patients to obtain an adequate sample and determine average values depending on the different levels of injury.  
Correlating the results with the respective clinical evaluations.

## CONCLUSIONS

The proposed method delivers 3 complementaries values easy to calculate. When calculating the correlation coefficients at various levels of injury (S1, L3), it appears that their values fall and the dispersal of some of its points are increased in SD according to expectations, but the amount sample is still insufficient.
